Executive summary

Linting report that shows the bad smells of the project encountered by Sonar’s Lint.

Revision table

Number	Date	Description
1	8/5/26	Creation and finishing of report

Introduction

In this document we will include a list of the bad smells encountered by Sonar's Lint after analysing our project, and a justification on why we believe that they are innocuous.

Bad smells

Resource	Date	Description
AuditReport.java	3 m...	Make "repository" transient or serializable.
Campaign.java	3 m...	Make "repository" transient or serializable.
Invention.java	2 m...	Make "repository" transient or serializable.

platform-production.properties	3 m...	Make sure this database password gets changed and removed fro...
platform-testing.properties	3 m...	Make sure this database password gets changed and removed fro...

Figure 1: bad smells encountered

Regarding “repository”

The bad smell “Make ‘repository’ transient or serializable” affects several classes: AuditReport, Campaign, Invention, Project, Sponsorship and Strategy. After making a check, all of them are already transient, so we can safely ignore it.

Regarding useless assignments.

The bad smell concerns the assignment of empty dictionaries to variables that are later assigned through a call to the repository, with the given types. We decided to maintain it as it didn't affect the code generating the code. This is the bad smell:

```
Map<Integer, Integer> activeDaysOfInventionsByProjectId = new HashMap<Integer, Integer>();
Map<Integer, Integer> activeDaysOfCampaignsByProjectId = new HashMap<Integer, Integer>();
Map<Integer, Integer> activeDaysOfStrategiesByProjectId = new HashMap<Integer, Integer>();
Map<Integer, Integer> membersByProjects = new HashMap<Integer, Integer>();
```

Figure 2: useless assignments

Regarding if statement

The bad smell “Merge this if statement with the enclosing one” happens as we only have an if inside another if statement, and it recommends just to put everything in one statement with AND operators. We decided not to correct that as it really doesn't hide any bugs, and it helps us to clarify the order and the different steps of what we are checking. Below there is a photo of the bad smell.

```
1 if (!super.getErrors().hasErrors("kickOffMoment") && !super.getErrors().hasErrors("closeOutMoment")) {
    if (this.project.getKickOffMoment() != null && this.project.getCloseOutMoment() != null) {
        // The CloseOutMoment must be after the KickOffMoment
        boolean validDates = this.project.getCloseOutMoment().after(this.project.getKickOffMoment());
        super.state(validDates, "closeOutMoment", "acme.validation.project.dates.message");
    }
}
```

Figure 3: merge if statement bad smell example

Regarding ValidTicker syntax

The bad smell “Use concise character class syntax ‘\d’ instead of ‘[0,9]’” doesn’t hide any bug, just a different way for representing how the syntax of the tickers must be. We didn’t correct it as in the model was specified as we wrote it.

Regarding Acme Framework

The bad smells regarding TestMomentHelper, platform-development.properties, platform-production.properties and platform-testing.properties belong to the Acme Framework, so we can safely ignore them.

Conclusions

This document highlights what errors have been encountered by Sonar’s Lint and its justification on why they haven’t been fixed. The ones encountered do not find any bugs, so we can safely ignore them as they don’t really affect our code.
